Reflection Paper: Building Your IT Career

1. What are the most important lessons you learned from the seminar?

One of the most valuable lessons I gained from the seminar is that pursuing a career in Information Technology requires patience, commitment, and a willingness to improve. Having technical knowledge is important, but we must also develop critical thinking, teamwork, and the ability to solve problems effectively. The seminar reminded me that success does not happen overnight; it comes from learning from our mistakes, accepting new challenges, and making consistent efforts to achieve our goals.

2. What new insights did you gain about cloud computing and its career opportunities in the IT industry?

The seminar helped me understand how cloud computing has changed the way people and organizations manage their digital resources. Instead of maintaining all their files, applications, and servers on physical computers, they can access services through the internet, making their operations more flexible and convenient. I also learned that cloud computing offers different service models, such as IaaS, PaaS, and SaaS, depending on the needs of the users. This knowledge introduced me to career opportunities in cloud technology, where IT professionals help organizations manage their systems, maintain data security, and improve their digital services.

3. How can Microsoft certifications and credentials help you improve your skills and career opportunities as an IT professional?

Microsoft certifications can serve as evidence of my knowledge and understanding of specific technologies. Preparing for these credentials also encourages me to study technical concepts more deeply and apply what I have learned through practical activities. They may help me stand out when applying for internships or entry-level IT positions because employers can see my commitment to professional development. More importantly, earning certifications can guide me toward specialized fields and help me identify which technical skills I need to strengthen.

4. What specific cloud computing or Microsoft technology skills would you like to learn or develop after attending the seminar?

After participating in the seminar, I became interested in developing my skills in Microsoft Azure, cloud infrastructure, and information security. I want to understand how cloud environments are configured, how users are given appropriate access, and how important information can be protected from unauthorized use. I also plan to improve my practical knowledge by creating small projects, exploring available learning resources, and completing guided exercises. By combining

theoretical knowledge with hands-on experience, I hope to become more confident in working with cloud-based technologies.

5. How do you plan to apply the knowledge and insights you gained from the seminar in preparing for your future IT career?

I intend to use the knowledge from the seminar as motivation to become more active in developing my IT skills. I will look for opportunities to apply what I learn in school projects, technical exercises, and personal activities related to cloud computing and Microsoft technologies. I also want to document my projects so I can gradually build a portfolio that demonstrates my abilities. Aside from technical development, I will continue improving my discipline, teamwork, and communication because these qualities are important when working with other IT professionals.

6. Based on the advice of our resource speaker, do you think it is advisable to apply directly to Microsoft after graduation? Why or why not? What preparations would you need to make to pursue this career opportunity?

I believe applying to Microsoft after graduation is worth considering because it could provide an opportunity to work with advanced technologies and learn from experienced professionals. However, I would treat this goal as a long-term career plan rather than expecting to be hired immediately. To prepare, I need to strengthen my foundation in IT, gain practical experience through projects or internships, and develop a portfolio that demonstrates my capabilities. I would also work toward relevant certifications, prepare a professional resume, and practice answering technical and behavioral interview questions. Regardless of the outcome, I would continue improving my skills and exploring other opportunities that could help me move closer to my desired career.
